

# RETELL AI

## Topic 8: Call Disconnection & Post-Call Summaries

### Assessment Configuration Report

**Agent:** Trainee\_Sarah\_Receptionist

**Prepared for:** Shaik Mohammad Shaheed

**Platform:** Retell AI Dashboard

#### Purpose

This report documents the visible configuration for call disconnection, speech handling, and post-call extraction. It separates configured settings from tests that have not yet been run.

**Status:** Configuration evidence collected. Live call behavior and extraction output remain unverified because no test call has been completed.

## 1. Call and Speech Settings

| Setting                    | Configured value / status                          |
|----------------------------|----------------------------------------------------|
| End Call on Silence        | 15 seconds                                         |
| Reminder Message Frequency | 8 seconds                                          |
| Maximum reminder count     | 1                                                  |
| Interruption Sensitivity   | 0.7                                                |
| Denoising Mode             | Remove noise                                       |
| Transcription Mode         | Optimize for speed                                 |
| Post-call memory           | Off (avoids displayed \$0.005 per-run memory cost) |

## 2. Post-Call Extraction Fields

| Field              | Type             | Extraction instruction                                                                       |
|--------------------|------------------|----------------------------------------------------------------------------------------------|
| is_lead_qualified  | Boolean / Yes-No | True only if caller asks to book, schedule, or confirm an appointment; otherwise false.      |
| caller_main_issue  | Text             | Summarize the main concern/request in 10 words or fewer. Example: Wants to book an           |
| caller_sentiment   | Selector         | Positive if polite/cooperative, Negative if angry/hostile, Neutral otherwise. Choices: Posit |
| satisfaction_score | Number           | Score satisfaction from 1 (worst) to 5 (best), based on tone and friendliness.               |

## 3. Expected Assessment Scenarios (Not Yet Executed)

**Inactivity:** Caller says “Hello, is anyone there?” and then stays silent. Expected: one reminder after about 8 seconds and call termination after 15 seconds of user silence, with inactivity as the reason where exposed by the platform.

**Appointment sample:** Caller requests an appointment tomorrow at 3 PM, gives the name John, and responds politely. Expected extraction: is\_lead\_qualified = true; caller\_sentiment = Positive; caller\_main\_issue = “Wants to book an appointment”; satisfaction\_score = 5.

These are expected results from the assessment scenario, not recorded test results.

## 4. Evidence and Verification

Screenshots captured during configuration show the agent dashboard, reminder values (8 seconds / 1 time), the 15-second silence setting, interruption sensitivity 0.7, four custom extraction fields, and “Remove noise” selected. The dashboard showed an Auto saved status.

**Not verified:** Real/simulated call flow, actual post-call extraction output, webhook event delivery, and publication/live deployment status. This report does not claim end-to-end test success.

Before submission, attach original dashboard screenshots and add a Loom walkthrough link if required by the LMS. Review the displayed per-minute cost before deciding whether to run a real call.
